1. HAML is a tool that can be used in behavior-driven web development, and allows for easy development of web pages. The disadvantage is that the syntax is not entirely clear-cut, so constant reference to the documentation seems to be somewhat essential.
2. Web testing requires a bit more setup, and is a little harder to understand.
3. I believe that Cucumber could be worth the time for absolutely anything. It's a very nice tool to use. It can be useful for small web applications, but probably becomes more useful the larger the project becomes.
